

## DEVELOPING COMMUNITIES

Large-scale mining is a large employer and powerful economic driver. Many gold deposits can only be profitably worked large-scale. There is however a paradox associated with large-scale mining in that whilst it generates national wealth, it often fails to provide relief from poverty for the residents of the host region.

Small-scale mining on the other hand requires little capital investment and places tangible wealth directly into the hands of the operator. In some countries up to 80% of all gold produced comes from small-scale mining operations.

Governments and agencies are looking to encourage small-scale mining as a means of poverty relief and latterly as the primary driver in developing community wealth, business and infrastructure.

Furthermore new technologies are required to increase efficiencies and eliminate the use of mercury which contaminates the ecosystem and impacts upon the health of small-scale miners.

The Ecologics high capacity step action pump and concentrator have been purpose developed for small-scale mining applications and represents our commitment to develop efficient, reliable and safe equipment to those people whom most require it.
